

CLAIMS

1. A polyolefin-based resin composition, containing
an addition polymerization-based block copolymer (I) and a
5 polyolefin-based resin (II), wherein:

the addition polymerization-based block copolymer (I)
is selected from block copolymers comprising at least one
polymer block A and at least one polymer block B, and the
hydrogenated products thereof;

10 the polymer block A essentially comprises an aromatic
vinyl compound unit containing at least 1% by mass of an
alkylstyrene-derived structural unit (a) in which at least
one alkyl group having 1 to 8 carbon atoms is bound to a
benzene ring; the polymer block B essentially comprises a
15 conjugated diene compound unit;

at least the moiety of polymer block A can undergo
crosslinking upon exposure to an active energy ray; and

after molded into a desired shape, the composition is
exposed to an active energy ray to carry out the
20 crosslinking reaction.

2. The polyolefin-based resin composition according
to claim 1, wherein the alkylstyrene-derived structural
unit (a) in which at least one alkyl group having 1 to 8
25 carbon atoms is bound to a benzene ring is a p-
methylstyrene unit.

3. The polyolefin-based resin composition according to claim 1 or 2, wherein the active energy ray is an electron beam.

5

4. The polyolefin-based resin composition according to any one of claims 1 to 3, further containing a photopolymerization initiator.

10 5. A molded article obtained from the polyolefin-based resin composition according to any one of claims 1 to 4.

15 6. A laminate comprising a layer formed of the polyolefin-based resin composition according to any one of claims 1 to 4.
